

Gages to get you around the corner, or around the bend

Gaging around an obstruction can make a simple task frustrating, sometimes leading to poor workmanship. It is a problem many OEM manufacturers and service parts suppliers have overcome with our gages.

Our stamping and bending facilities will enable you to design a way around obstructions. Special cut off, grinding, and laser capabilities allow us to manufacture the right tool to do the job right.

If we can't get around it by bending, we can manufacture assemblies that are precise and durable. In many cases, the measuring blade is made from our standard close tolerance feeler gage stock, securely silver-soldered to a custom handle. Special blades are also available.

We can also provide gages with special markings, blade shapes, blade sizes, assembly options, and packaging to meet your needs.

Call us with your production gage design challenge. Our experienced technicians, supported by our state of the art equipment, will provide you with a cost-effective solution to improve your productivity.
